-I- ALTERNATIVE PRODUCTS: 2 isoforms; 1 (shown here)
produced by alternative splicing.
-I- SIMILARITY: BELONGS TO FAMILY 2 OF G-PROTEIN COU-
-I- SIMILARITY: CONTAINS 9 CADHERIN DOMAINS.
-I- SIMILARITY: CONTAINS 8 EGF-LIKE DOMAINS.
-I- SIMILARITY: CONTAINS 1 LAMININ G-LIKE DOMAINS.
-I- SIMILARITY: CONTAINS 1 LAMININ EGF-LIKE DOMAIN.
-I- SIMILARITY: CONTAINS 1 GPS DOMAIN.

At E10, expression is strong in the ventricular zones (VZ) in all sectors of the brain, and lower in the marginal zones (MZ). Between E12 and E15, expression is prominant in the brain. It is strong in VZ, lower in MZ, except in telecephalic MZ where it is predominant. The intensity is higher in all VZ, and lower in differenciating fields than in VZ, except in the cerebral hemispheres, and to a lesser extent in the tectum and cerebrellum. A weak expression is also observed in the fetal lungs, kidney and epithelia. In the newborn and postnatal stages, expression remains restricted to the VZ as well as in migrating and postmigratory cells throughout the brain.

-ITISSUE SPECIFICITY: Expressed in the CNS and in the eye.
-ISIMILARITY: BELONGS TO FAMILY 2 OF G-PROTEIN COUPLED RECEPTORS.

FUNCTION: Receptor that may have an important role in cell/cellstynellog during nervous system formation.

SUBCELLULAR LOCATION: Integral membrane protein.

DEVELOPMENTAL STAGE: Predominantly expressed in the developing
                                                                                                                                                        CNS, the emerging dorsal root ganglia and cranial ganglia. In the CNS, expression is uniform along the rostrocaudal axis. During gastrulation, it is expressed within the anterior neural ectoderm. At E10, expression is strong in the ventrianian arrange.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      KVRKEYGKCLRTHCCSGKSTESSI--GSGKTSGSRTPGRYSTGSQSRIRRMWNDTVRK--

DNA Res. 5:31-39(1998).

-i- FUNCTION: MIGHT BE INVOLVED IN ANGIOGENESIS INHIBITION AND SUPPRESSION OF GLIOBLASTOMA.

-i- SUBCELLULAR LOCATION: Integral membrane protein.

-i- ALTERNATIVE PRODUCTS: 2 ISOFORMS; A LONG FORM (SHOWN HERE).

SHORT FORM; MAY BE PRODUCED BY ALTERNATIVE SPLICING.

-i- TISSUE SPECIFICITY: STRONGLY EXPRESSED IN BRAIN. ALSO DETECHERATI.

HEART. REDUCED EXPRESSION IS OBSERVED IN SOME GLIOBLASTOMA
                                                                                                                                                                       TRANSMEM

A Formstone C.J., Barclay J., Rees M., Little P.F.R.;

The candidate for the tippy (tip) lethal mutant on chromosome 9.";

I Mamm. Genome 11:392-394(2000).

C -!- FUNCTION: Receptor that may have an important role in cell/c elements.

C -!- SUBCELLULAR LOCATION: Integral membrane protein.

C -!- SUBCELLULAR LOCATION: Integral membrane protein the cNS, the protection of the cNS, the company dorsal root ganglia and cranial ganglia. In the CNS expression is uniform along the rostrocaudal axis. No expression is detected until somite stages. Between El0 and El2, expression.

Biophys. Res. Commun. 247:597-604(1998).

-i- FUNCTION: LIKELY TO BE A POTENT INHIBITOR OF ANGIOGENESIS IN BRAIN AND MAY PLAY A SIGNIFICANT ROLE AS A MEDIATOR OF THE F SIGNAL IN SUPPRESSION OF GLIOBLASTOMA. MAY FUNCTION IN CELL ADHESION AND SIGNAL TRANSDUCTION IN THE BRAIN.

-i- SUBGUNIT: INTERACTS WITH BAP1.

-i- SUBCLILULAR LOCATION: INTEGRAL MEMBRANE PROTEIN. LIKELY TO E CONCENTRATED AT CELL-CELL ADHESION SITES.

-i- TISSUE SPECIFICITY: SPECIFICALLY EXPRESSED IN BRAIN. REDUCED.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This SWISS-PROT entry is copyright.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  is concentrated at proximal and distal cell boundaries with little or no expression at anterior and posterior boundaries. When prehairs emerge at 30-36 hours apf, expression becomes evenly distributed again along the whole cell boundary.

TISSUE SPECIFICITY: In the pupal wing, expressed at relatively even levels in all regions. Abundant in 6-9 hour embryos. Expressed at higher levels in pupae than larvae.

EXPRESSED TO FAMILY 2 OF G-PROTEIN COUPLED RECEPTORS. SIMILARITY: CONTAINS 8 CADHERIN DOMAINS.

SIMILARITY: CONTAINS 1 CAMININ G-LIKE DOMAINS.

SIMILARITY: CONTAINS 1 GPS DOMAIN.
